Abstract

This paper is aimed at the conservation and development of medicinal plants in conservation and development of medicinal plants. These plants consist of 362 species, 113 families, 56 classes and 8 orders which belong to 6 phyla of all the parts of plants. Roots are mostly used for medicinal treatment with leaf, bark and fruit, used respectively. Medicinal plants are being used to treat 16 group of diseases. Among these medicinal plants, there are 14 species are listed in IUCN Red List 2018, 14 species in Vietnam Red List 2007 and 3 species in Decree 32 of the Vietnamese government. Due to supply being higher than demand, local people do not like to plant medicinal plants in the region. Because the women in Pu Hu nature reserve are mainly responsible for the health and care of their household, they have better knowledge on medicinal plant than men and are mainly engaged in collecting medicinal plants. Derived from the factors that affect the development of medicinal plants at Pu Hu Nature Reserve, a proposal of solutions include: management, technical solutions, social policies.

INTRODUCTION

From time immemorial, mankind has known to use medicine from plants to treat health problems. Medicinal plants are potential sources of new drugs and hold a great value for developing pharmaceutical products, phyto medicines, and dietary supplements (Hoang et al. 2008). About 80% of the world's population relies on traditional medicine, especially in remote areas in developing countries, medicinal plants may form the only available source of health care. (Van Andel 2000); (Hoang et al. 2008). Located in the belt of tropical monsoon, Vietnam has high biodiversity with approximate 11,000 species of vascular plants, so it plays an important role in medicinal source. (Chi 1997). Vietnam has 54 ethnic groups living together and they have their own traditional culture and experiences in the makeup and use of medicinal plants. However, Vietnam is also one of the countries with a high rate of deforestation. Forest resources will be destroyed including many medicinal plants. In addition, the old generations

pass away while the young generation demonstrate little interest in learning the methods to make medicine from medicinal plants and the rapidly development of modern medicine which lead to the traditions being lost day by day. Pu Hu Nature Reserve belongs to the Muong Lat and Quan Hoa districts and located in the North-west of Thanh Hoa province. The area contains many valuable medicinal herbs. Nevertheless, local exploitations of medicinal plants are directly narrowing off their distribution. This study focuses on the situation of traditional medicinal plants, local knowledge of medicinal plants and solutions for conservation and development of medicinal plants in Pu Hu Nature Reserve.

MATERIAL AND METHODS

A random sample of 100 households in 2 surrounded communes (Nam Tien commune belongs to Quan Hoa district and Trung Ly commune belongs to Muong Lat district) is selected in a survey.

The standard interviews contained specific questions on age, gender, and ethnic background of the gatherers and main users of plant products (Martin 1995). Additionally we used the ‘walk-in-the-wood’ method (Prance et al. 1987) to determine which products are harvested (for what purpose) in the forests surrounding the villages. These trips were also used to collect voucher specimens for reliable identification of the harvested plants. Special collecting trips were organized with indigenous experts, e.g., traditional doctors, village elders and other local people who knew about medicinal plants (Hoang et al 2008). Additional, we also interviewing 20 staff members, who work in management at the board of Pu Hu nature reserve by using checklists to get information and data on the issues of Current population, living standard of local communes. Most information was confirmed by other informants. The information was also

checked and compared with the ‘Vietnam medicinal plants’ (Loi 1995), ‘Dictionary of medicinal plants of Vietnam’ (Chi 1996), and ‘An illustrated Flora of Vietnam’ (Ho 2000).

Medicinal plant species were identified by experts at the Vietnam National University of forestry. The specimens also double checked with specimens in herbarium VNF.

RESULTS

Current status of medicinal plants in Pu Hu nature reserve

Diversity of medicinal plants

A total of 362 medicinal plant species were found in Pu Hu Nature Reserve belonging to 113 families and 6 phyla. Most of the medicinal plant species in Pu Hu Nature Reserve are angiosperms, 3 species belong to the gymnosperms and 20 species are ferns (Table 1).

Table 1: Medicinal plants in Pu Hu Nature Reserve

Phylum	Class		Order		Family		Species	
	Quantity	(%)	Quantity	(%)	Quantity	(%)	Quantity	(%)
PSILOTOPHYTA	1	12.5	1	2	1	0.9	1	0.3
LYCOPODIOPHYTA	1	12.5	1	2	1	0.9	2	0.6
EQUISETOPHYTA	1	12.5	1	2	1	0.9	1	0.3
POLYPODIOPHYTA	2	25	6	11	13	11.5	20	5.5
PINOPHYTA	1	12.5	1	2	3	2.7	3	0.8
MAGNOLIOPHYTA	2	25	46	82	94	83.2	335	92.5
Total	8	100	56	100	113	100	362	100

Diversity of plant parts use

Different plant parts are used to treat different diseases: In some medicinal plant species the whole plant can be used, whereas for other species several components or only one component can be used for disease treatment.

Roots are the dominant used part (154 species). There were 140 species in which leaves were used as medicinal material. Barks and whole plant followed with medium amount of use with 70 and 88 species respectively. The amount using the fruit, seed, and stem was lower with 49 species, 38 species and 35 species respectively. Slightly lower was the amount using the flower (21 species) and branch (14 species). The least one was tuber part with only 7 species have this part used as medicinal material. The part used diversity is showed in Figure 1.

Habits of medicinal plants

The medicinal plants in Pu Hu Nature Reserve mainly belong to 4 habits including herb, shrub, vine and tree. The highest percentage is tree habit with 36% with herb habit at 27%. With 24% the shrub habit followed in third and the last one is vine habit (13%). The difference in the amount among each habit is negligible.

Disease treated with medicinal plants

The traditional medicine has proved that a plant can be used to treat several diseases and a disease is only completely treated when using many species of plants. Following Vo Van Chi (1997), Do Tat Loi (2005), the usage of medicinal plants of Pu Hu nature reserve is divided based on groups of diseases as table below:

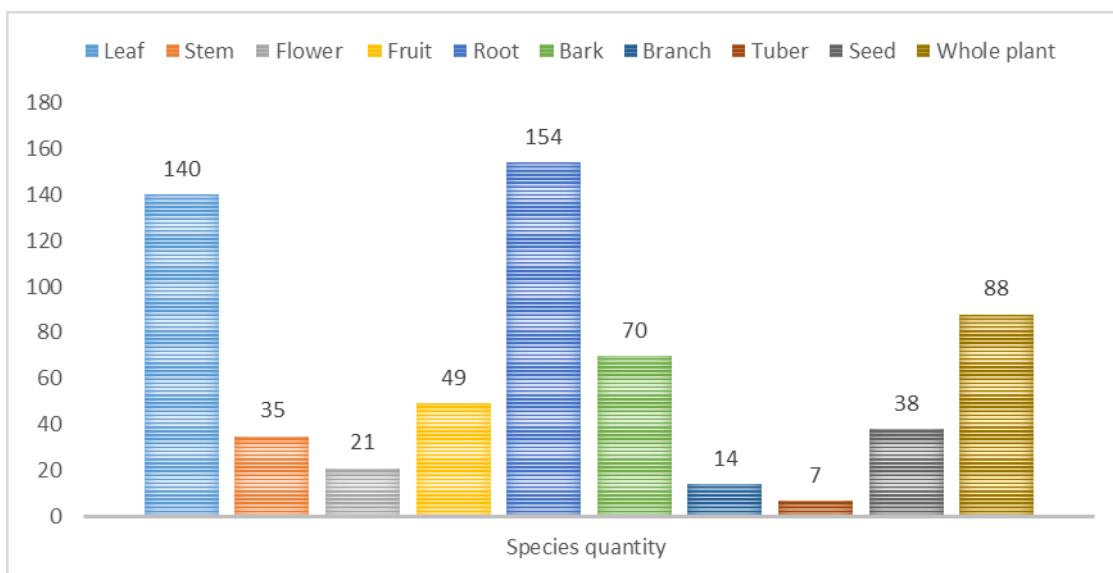

Figure 1: Diverse parts of medicinal plants in Pu Hu Nature Reserve

Table 2: Group of diseases treated with medicinal plants

No	Disease group	Quantity
1	Poisoning	106
2	Diseases caused by weather	92
3	Cutaneous diseases	68
4	Female diseases	44
5	Other	43
6	Respiratory diseases	40
7	Urinary diseases	36
8	Animal bites	32
9	Digestive diseases	24
10	Good for health	20
11	Dental diseases	20
12	Male diseases	15
13	Renal diseases	10
14	Gastric diseases	7
15	Eye diseases	7
16	Nerve diseases	6

The 362 medicinal plants are being used to treat 16 groups of diseases. Species are used to treat diseases about causes of poisoning which are dominant, and the last one are species which treat nerve diseases.

Threatened medicinal plants in Pu Hu Nature Reserve

According to the Vietnam Red List 2007, IUCN 2018 and Decree 32/2016 on management of forest flora and fauna endangered, rare and precious, 26 medicinal plant species which need

priority for conservation were determined in mountainous areas of Pu Hu nature reserve (Table 3)

Who is collecting medicinal plants

From interviewing households and key informants, it emerged that women collect medicinal plants more than men at almost every age level, especially in the age classes of over 50 years old. This indicates that women in Pu Hu nature reserve are mainly responsible for health care of their household, they have better knowledge on

medicinal plant than man and also mainly engaged in collecting medicinal plants. Young people are rarely engaged in collecting medicinal plants, especially do not have any young people younger than 16 years old collect medicinal plant in

the research area (table 4). This result also the same in Ben En national park (Hoang et al 2008). However, in Ben En National park local people younger than 16 years old still involve on collecting medicinal plant species.

<i>Average % of Males</i>		31
<i>Average % of Females</i>		69

Status of harvesting and planting medicinal plant species

The local people do not harvest medicinal plants regularly. The quantity of medicinal plants harvested, depend on the demand of each family. They only harvest the species that are needed to treat the relative contracted disease. The quantity of species that each family here harvest every year are from 20 to 50 species. It shows that local people in Pu Hu Nature Reserve mainly harvest medicinal plants for on use and far less for commercial purpose. Due to the amount of medicinal plants in Pu Hu Nature Reserve were enough and even higher than demand for use by locals, with a small number of local people choosing to plant medicinal plants. Moreover, they only choose to plant some medicinal plants which have high economic value like *Drynaria fortunei*, *Eleutherococcus trifoliatus*, *Amomum longiligulare*, *Morinda officinalis* ...ect.

Solution proposals for conservation and development of medicinal plants in Pu Hu Nature Reserve.

To preserve and develop a species that cannot be separated from the management and protection of their habitat. Derived from the factors that affect the development of medicinal plants at Pu Hu Nature Reserve and the Government's regulations on forestry, the advantages and disadvantages of development, a proposal of solutions for sustainable development were made, including:

Management solutions: Strengthening the management and effective monitoring of forest activities: Frequently patrolling, controlling, and detecting illegal activities of non-timber forest products, including medicinal plants. Sending staff to participate in training courses on surveying and techniques for plantation, development and plant protection for medicinal plants.

Technical solutions: Carry out zoning activities to promote natural regeneration of the medicinal species in the authorized area. Establish nurseries, select provenances of high yielding and good quality seedlings for replanting and modeling of medicinal

plants under a forest canopy. Invest in modern equipment for research and propagation of each species.

Social policy solutions: Raise people's awareness about the value and benefits of biodiversity conservation in general and especially the medicinal plants, by organizing propaganda activities at each commune. Set up training materials and open training courses for farmers to propagate and plant some species. Encourage local people to participate in the development of some species in the household garden, plantation forest or community-managed forest.

CONCLUSION

Medicinal plants in Pu Hu Nature Reserve, Thanh Hoa province is diverse, it consists of 362 species, 113 families, 56 classes and 8 orders which belongs to 6 phyla of all the parts of plants, the roots are the most used for medicinal treatment, with leaf, bark and fruit, respectively. Medicinal plants are being used to treat 16 group of diseases. Among these medicinal plants, there are 14 species are listed in IUCN Red List 2018, 14 species in Vietnam Red List 2007 and 3 species in Decree 32 of Vietnamese government. Due to the supply is quite higher than demand then local people do not prefer to plant medicinal plants in the region. Women in Pu Hu nature reserve are mainly responsible for health care of their household, they have better knowledge on medicinal plant than man and also mainly engaged in collecting medicinal plants. Derived from the factors that affect the development of medicinal plants at Pu Hu Nature Reserve, a proposal of solutions are management solutions, technical solutions, social policy solutions.

ACKNOWLEDGEMENT

This research is funded by Vietnam National Foundation for Science and Technology Development (NAFOSTED) under grant number 106.06-2018.23. Authors are very grateful to many staff members and local inhabitants in Pu Hu Nature Reserve for their support of our activities, especially Mr. Le Duy Cuong and Mr. Nguyen Dinh Hieu.
